

Poly Carbonate Labels: are commonly used for switches, automotive panels, product identification labels and panel overlays. Because they are easy to die cut, emboss and print poly carbonate offers product designers more freedom than some other materials.

Polyester Labels: are used for many of the same applications as poly carbonate nameplates, except they are more chemical resistant, more tear resistant and can stand up to the elements much better. Polyester nameplates are durable, clear and are resistant to shrinking or stretching.

Industrial Decals: We have been offering a widely appreciated range of decals which is manufactured while following international standards of industry. These decals are plastic, cloth paper or ceramic substrate with a specified pattern printed over them. This pattern can be moved to another surface generally with the aid of water or heat.
